

## Setting up the Training.mdb local database

1. Using the Setup program of ICIS, use the following information to create the local database:
  - a. The target directory should be **C:\ICIS5** or the top of the ICIS tree whatever it is called.
  - b. Crop implementation should be **IRIS**
  - c. Select the *update existing installation*, and choose LOCAL FOR THE IRIS RICE BREEDING TRAINING COURSE.
  - d. User name and password should be **RBREED**
  - e. The filename should be **Training.mdb**
  
2. Once the installation is complete replace the Training.mdb in the C:\ICIS5\Database\IRIS\Local with the Training.mdb found in the “\ICIS5\Documents\TDM\II Users Manual and Training Material\C. Breeder's Training Course\02 03&4&5\_Making Crosses and Establishing the Pedigree Nurseries” folder.  
This is the starting stage of the local database that participants should use.
  
3. Test if the SetGen will run.
  
4. Every stage of the training, we should replace the local database in all computers with the local database found in the folder that corresponds with the stage of the training session. Example: After the practical exercise of session 2 with is “Making Crosses and Establishing the Pedigree Nurseries”, we should replace the local database with the local database found in folder of session 3, which is “Reserving of Seed Stock for HB List”.
